

Port Automated Driving Report, 2021

May 2021

STUDY GOAL AND OBJECTIVES

This report provides the industry executives with strategically significant competitor information, analysis, insight and projection on the competitive pattern and key companies in the industry, crucial to the development and implementation of effective business, marketing and R&D programs.

REPORT OBJECTIVES

- ◆ To establish a comprehensive, factual, annually updated and cost-effective information base on market size, competition patterns, market segments, goals and strategies of the leading players in the market, reviews and forecasts.
- ◆ To assist potential market entrants in evaluating prospective acquisition and joint venture candidates.
- ◆ To complement the organizations' internal competitor information gathering efforts with strategic analysis, data interpretation and insight.
- ◆ To suggest for concerned investors in line with the current development of this industry as well as the development tendency.
- ◆ To help company to succeed in a competitive market, and

METHODOLOGY

Both primary and secondary research methodologies were used in preparing this study. Initially, a comprehensive and exhaustive search of the literature on this industry was conducted. These sources included related books and journals, trade literature, marketing literature, other product/promotional literature, annual reports, security analyst reports, and other publications.

Subsequently, telephone interviews or email correspondence was conducted with marketing executives etc. Other sources included related magazines, academics, and consulting companies.

INFORMATION SOURCES

The primary information sources include Company Reports, and National Bureau of Statistics of China etc.

Abstract

The surging global freight shipping rates will rev up the deployment of automated driving in ports.

The global freight shipping rates have enjoyed a marked increase since June 2020, for example, from USD1,358 per FEU on March 5, 2021 to USD4,115 per FEU on March 6, 2021. The frequent shipping crises in 2021 have forced many exporters to sign freight contracts for the next 12 months at high prices.

A combination of factors including soaring demand for goods boosted by global fiscal and monetary stimulus, saturated ports, and shortage of ship and dock workers and truck drivers trigger the increase in shipping costs. Port operators are keen on higher operation efficiency and solutions to labor shortage.

Globally, foreign countries made an early start on straddle carrier and AGV, having won a place in the market. Yet it is hard for them to accelerate port container turnover and lower operating cost in a short time, due to rising international shipping costs, too long time taken to deploy AGVs, and larger space needed for autonomous straddle carriers. While, autonomous container trucks cost less than other solutions, its rapid deployment only requires introduction of intelligent roadside facilities to existing smart terminals. It is predicted that large container ports worldwide will work to deploy autonomous container trucks from 2021 onwards.

As a key importer and exporter in the world, China is trying hard to promote autonomous driving that enables port logistics and enhance the construction of new-generation automated terminals and the mass adoption of autonomous container trucks. By 2025, some coastal container hub ports should preliminarily build intelligent systems that enable comprehensive perception, internet of everything, and port-truck cooperation; by 2035, container hub ports should complete the construction of intelligent systems, according to the Guideline to Accelerate the Building of World-class Ports issued by the Ministry of Transport of China. Faster progress in construction of “new infrastructure” in ports comes with the boom of 5G, CVIS and autonomous driving technologies.

Distribution of Smart Ports under Construction in China

Construction is in full swing in the east coast

Extend to ports along the River in the central region

The central region along the River:
The construction of smart ports has extended to the ports along the River in the central China.

Bohai Economic Rim:

The construction of smart ports in Tianjin, Shandong and Liaoning is in full swing; Hebei is also working on it.

Yangtze River Delta region:

Main ports in Shanghai and Zhejiang have made every effort to become smart; the construction of Nanjing smart port demonstration project in Jiangsu is under way.

Pearl River Delta region:

Guangzhou and Shenzhen continue to implement their smart port strategies.

Source: Shanghai Maritime University

Autonomous logistics covers the whole process from port shipping hubs to trunk highways.

Port automated driving is a typical closed scenario of low speed operation and a representative scenario that is the first one to allow for commercial use of autonomous driving. In current stage, China boasts the ownership of more than 25,000 container trailers, but most port terminals still depend on manned container trucks, with the penetration of autonomous ones lower than 2%.

It is expected that in 2025, 6,000 to 7,000 L4 autonomous container trucks will come into service in Chinese ports, with their penetration over 20%; China's port automated driving market will be worth more than RMB6 billion in 2025, holding roughly 30% of the global market.

Port Automated Driving Market Size in China, 2019-2025E

Source: ResearchInChina

Despite not a big market, port automated driving creates a demonstration effect and many derivatives, such as autonomous logistics scenario covering the whole process from shipping to port and then to trunk highway and logistics hub.

At first, port autonomous container trucks take priority to acquire the rights of transporting containers from ships to container yards to distributing centers. On one estimate, China's trunk logistics market valued at RMB5 trillion or so (approximately USD700 billion) attracts autonomous driving investors. In 2020, half the autonomous driving funding cases in China targeted start-ups making deployments in commercial vehicles. Among the 19 investees, 8 that deploy trunk logistics scenarios averagely raised more funds than those focusing on other segments.

On April 15, 2021, TuSimple listed its shares on Nasdaq, with the first-day closing price at USD40 a share sending its market capitalization to USD8.48 billion. TuSimple concentrates on L4 automated driving for such logistics scenarios as highways, ports and sites. In March 2021, TuSimple became qualified for intelligent connected vehicle demonstration application in Shanghai, which allows it to carry out load tests on designated test roads in the downtown, Lingang Logistics Park, East Sea Bridge and Yangshan Port within the Lin-gang Special Area of China (Shanghai) Pilot Free Trade Zone.

Port logistics has been a critical application scenario of autonomous vehicles. That is mainly because:

First, port automated driving can be deployed in the shortest time, pays off and offers a clear business model. It is expected the commercial use of port automated driving will be widespread in the next two or three years. Actual operation of automated driving that needs heavy investment and has a long payback period, allows for testing technologies in ports and also brings benefits, making the commercial operation a reality in a short term.

Second, it takes just one or two years to extend the commercial use of automated driving from ports to trunk logistics, because the two scenarios share hardware devices of commercial vehicles like chassis and use the common engineering approaches, and the large-scale commercial operations in ports will accumulate and iterate capabilities of algorithm, engineering, operation and commercialization rapidly, preparing for future extension to external container trucks and trunk logistics.

China already has 13 ports introducing autonomous container trucks.

Since 2018, China has speeded up construction of autonomous ports. Quite a few autonomous driving solution providers have phased in application to autonomous trucks for commercial trial use. At present, there are 13 ports applying autonomous container trucks, including Shanghai Yangshan Port, Tianjin Port, Mawan Port, Ningbo Zhoushan Port, Zhuhai Port and Xiamen Port, which forms a “north-central-south” coastal deployment pattern.

China: port automated driving is often found in the southeast coastal ports, especially in new or expanded coastal port projects like Shenzhen Mawan Smart Port, Shanghai Yangshan Port, Ningbo Zhoushan Port and Tianjin Port, while hardly seen in inland ports and river terminals due to more bulk cargos and less containers there.

Overseas: Chinese companies are making an aggressive expansion in overseas markets. In 2020, Shanghai Zhenhua Heavy Industries (ZPMC) and Westwell Lab began to operate Westwell Lab Q-Truck at Khalifa Port Container Terminal Phase II in Abu Dhabi, UAE; in April 2020, Westwell Lab's 6 Q-Truck trucks went into operation in Laem Chabang, Thailand and completed 12-hour continuous loading and unloading operation.

In the scenario of horizontal transportation at port container terminals, autonomous driving solutions that enable single vehicles are not enough to meet the current actual needs of smart terminals. Fleet-level scheduling systems are thus needed to bridge the gap between the original production operation system and single vehicles to let the two systems work together smoothly for higher overall efficiency.

Autonomous Truck Operation Projects of Ports in China

Time	Port	Participants	Vehicle Model
Mar. 2021	Shandong Rizhao Port	Rizhao Port Container Development Co., Ltd., China Mobile Rizhao Branch	Trucks of Sinotruk
Jan. 2021	Xiamen Ocean Gate Terminal of COSCO SHIPPING Ports Limited	COSCO SHIPPING Ports Limited under COSCO SHIPPING Group, Dongfeng Tucks, China Mobile, etc.	Container trucks of Dongfeng Tucks
Dec. 2020	Ningbo-Zhoushan Port Meishan Zone	ZPMC, Ningbo Meidong Container Terminal Co., Ltd., FABU.AI	13 intelligent container trucks
Aug. 2020	Mawan Smart Port	CMHIT, SCCT, Yunshan Technologies, Sinotruk, Sany Marine Heavy Industry, etc.	Trucks of Sinotruk, autonomous battery electric container trucks of Sany
May 2020	Wuhan Huashan Port	Tri-Ring Group, China Telecom Hubei Company, Wuhan Port Group, Wuhan Aisimba Technology	Intelligent container straddle carriers of Tri-Ring Group
Jan. 2020	Tianjin Port	Tianjin Port, the research team led by Li Deyi (a fellow at Chinese Academy of Engineering), Sinotruk, Beijing Trunk Technology, etc.	25 Sinotruk HOWO T5G autonomous electric trucks
Nov. 2019	Tangshan Port	China Mobile Tangshan Branch, Tangshan Port Group, Sinotruk, HiRain Technologies, etc.	5 autonomous test container trucks
Nov. 2019	Shanghai Yangshan Port	SAIC, Shanghai International Port (Group) Co., Ltd. (SIPG), China Mobile, TuSimple, Shaanxi Heavy Duty Automobile, etc.	Trucks of SAIC-Iveco Hongyan Commercial Vehicle and Shaanxi Heavy Duty Automobile
Oct. 2018	Yantian International Container Terminal	Westwell Lab, Hutchison Port	Westwell Lab Well-Truck
Apr. 2018	Hebei Caofeidian Port	TuSimple, Shaanxi Heavy Duty Automobile	Trucks of Shaanxi Heavy Duty Automobile
Apr. 2018	Qingdao Port	PLUS.AI, FAW Jiefang	FAW Jiefang J7 FAW Jiefang non-cabin ICV
Jan. 2018	Guangdong Zhuhai Port	Zhuhai Port, Westwell Lab	SAIC-Iveco Hongyan Genlyon
Dec. 2017	Tianjin Port	Tianjin Port, Sinotruk, Beijing Trunk Technology	Sinotruk HOWO

Development Trends of Port Automated Driving

5G-based network communication (5G Port Private Network+MEC+V2X): “port automated driving” requires low latency, large bandwidth, high reliability communication connections; communication systems for large special operation equipment for automated terminals need to afford efficient and reliable transmission of control, multi-channel video and other information. 5G V2X is a new engine for the construction of “smart ports”.

In September 2020, Beijing Trunk Technology Co., Ltd.'s autonomous container trucks packed 5G V2X technology, a solution to ultra-long truck queues in port logistics hubs. 5G V2X enables autonomous container trucks to perceive more widely for better interconnection with other production equipment and systems in port areas. Moreover, based on low-latency, high-bandwidth 5G networks, the cloud computing and remote monitoring services enable real-time system optimization, intelligent scheduling control and remote driving.

Electrified/hydrogen fuel-powered: transport vehicles in autonomous ports feature electric drive, quicker response, direct power supply to the autonomous driving system, and higher efficiency than fuel-powered vehicles. Electric vehicles for autonomous ports hold the trend. Among current autonomous container trucks operated in ports, 8 models, or 61.5% of the total are electric drive.

SAIC-Iveco Hongyan Commercial Vehicle Co., Ltd. has introduced intelligent hydrogen fuel cell heavy trucks, giving full support to construction of green ports and green transportation systems. In April 2020, Shenzhen Center Power Tech. Co., Ltd. made a strategic investment in Westwell Lab, aiming at co-developing port hydrogen-powered autonomous vehicles and building a port AI + hydrogen energy ecosystem in an age of 5G+AIoT.

Top-level design: through the lens of digitalization in the whole industry, port scenario lags behind others in such as digital concept and new technology application. Greater effort should be made on new digital technology development and top-level design, and data flow + business flow development plan on the basis of other technologies. Top-level design brings a shake-up to existing port information and intelligent construction resources.

In January, 2021, Beijing Trunk Technology Co., Ltd. and Huawei signed a cooperative agreement in Tianjin Port. With its 5G technology, Huawei provides “Car Cloud”-“Roadside”-“Car End” port intelligent driving solutions. In August 2020, Alibaba Cloud won the bidding of Shandong Port Group (China’s first smart port owning 4 port companies: Qingdao Port, Rizhao Port, Yantai Port and Bohai Bay Port) for top-level design schemes.

Platooning/CVIS: in the closed port environment with multiple scenarios, autonomous container trucks need to communicate with other container trucks, other types of vehicles, port equipment and containers. Fleet operation and CVIS is a trend for port automated driving.

In November 2020, the platooning of 13 autonomous container trucks independently developed and delivered by Beijing Trunk Technology Co., Ltd. was carried out in Ningbo Zhoushan Port. This is another delivered mass-production project of the company following the commercial order for 25 autonomous container trucks from Tianjin Port.

01 Overview of Automated Driving for Autonomous Ports

- 1.1 Introduction to Autonomous Ports and Automated Driving
- 1.2 Classification of Port Automated Driving
 - 1.2.1 Three Automation Solutions for Port Automated Driving
 - 1.2.2 Comparison of Advantages and Disadvantages between Automation Solutions for Port Automated Driving
 - 1.2.3 Port Container Straddle Carrier
 - 1.2.4 Competitive Landscape of Port Container Straddle Carrier Industry
 - 1.2.5 AGV (Automated Guided Vehicle)
 - 1.2.6 AGV Application
 - 1.2.7 Port Autonomous Container Trucks
- 1.3 Advantages of Port Automated Driving (1)
- 1.4 Advantages of Port Automated Driving (2)
- 1.5 Port Automated Driving Industry Chain
- 1.6 Development Trends of Port Automated Driving

02 Status Quo of Port Automated Driving Market and Forecast

- 2.1 Standards and Policies Concerning Port Automated Driving Industry
 - 2.1.1 China's Port Automated Driving Industry Policies
 - 2.1.2 Smart Port Demonstration Projects Announced by the Ministry of Transport of China

- 2.1.3 Smart Port Construction Directions
- 2.1.4 China's Port Automated Driving Industry Standards
- 2.1.5 Foreign Policies and Standards Concerning Port Automated Driving
- 2.2 Status Quo of Port Industry
 - 2.2.1 Global Port Container Throughput
 - 2.2.2 Port Container Throughput in China
 - 2.2.3 Overall Workflow of Ports
 - 2.2.4 Importance and Dilemma of Port Logistics Development
 - 2.2.5 Value of Port Automated Driving
- 2.3 Port Automated Driving Market Size
 - 2.3.1 Development Plans for Port Automated Driving
 - 2.3.2 Global Port Automated Driving Market Size
 - 2.3.3 China's Port Container Market Size
 - 2.3.4 Estimated Port Automated Driving Cost in China
 - 2.3.5 Port Automated Driving Market Size in China
 - 2.3.6 Ownership of L4 Internal Autonomous Container Trucks in China
- 2.4 Port Automated Driving Industry Chain and Business Models
 - 2.4.1 Industrial Chain Architecture
 - 2.4.2 Industry Chain Enterprises
 - 2.4.3 Three Business Models
 - 2.4.4 Business Models-Cooperation Mode

2.5 Competitive Landscape and Financing of Port Automated Driving

2.5.1 Competitive Landscape of Port Automated Driving Industry

2.5.2 Scale, Cooperative Ports and Product Routes of Port Automated Driving Players

2.5.3 Financing of Port Automated Driving Players

2.6 Classification of Port Autonomous Vehicles

2.7 Problems and Challenges in Development of Port Automated Driving

2.7.1 Current Development Characteristics

2.7.2 Main Problems in Operation

2.7.3 Technical Challenges

2.7.4 Development Trends

2.7.5 Phased Development Goals

03 Port Automated Driving Solutions and Development Trends

3.1 Solution Framework

3.1.1 Classification of Solutions

3.1.2 Solutions—Westwell Lab Automated Driving Solution

3.1.3 Main Application Technologies

3.1.4 Homemade AI Chips to be Applied to Port Automated Driving

3.1.5 Heading Data Intelligent Provides HD Maps for Shanghai Yangshan Port Terminal

3.1.6 DeepMotion Provides Vision-based HD Map Solutions for Shanghai Yangshan Port

3.2 Port Automated Driving Technology Trends (1)

3.3 Port Automated Driving Technology Trends (2)

3.4 Port Automated Driving Technology Trends (3)

3.5 Port Automated Driving Technology Trends (4)

04 Port Automated Driving Application Cases

4.1 Summary of Port Automated Driving Scenario Applications

4.1.1 Application of Single Autonomous Container Trucks in China (1)

4.1.2 Application of Single Autonomous Container Trucks in China (2)

4.1.3 Application of Single Autonomous Container Trucks in Foreign Countries

4.1.4 Ship Container Loading and Unloading Operation

4.2 Automated Driving in Tianjin Port

4.2.1 Demonstration Zone

4.2.2 5G Remote Control and Whole Loading and Unloading Process

4.2.3 Ship Container Loading and Unloading Operation

4.3 Phase IV Autonomous Terminal of Shanghai Yangshan Port

4.3.1 AGV

4.3.2 5G Intelligent Heavy Duty Truck

- 4.4 Operation of Autonomous Container Trucks at Xiamen Ocean Gate Terminal of COSCO SHIPPING Ports Limited
- 4.5 Mawan Smart Port 5G+ Automated Driving Project
- 4.6 New Explorations of Autonomous Ports

05 Main Port Automated Driving Players

5.1 Westwell Lab

5.1.1 Profile

5.1.2 Development History of Autonomous Ports

5.1.3 WellOcean Smart Port System

5.1.4 Port Automated Driving Solutions

5.1.5 Autonomous Electric Heavy Truck

5.1.6 Autonomous Port Solutions

5.1.7 Port Remote Operation System

5.1.8 Brain-inspired Neurochip

5.1.9 Port Automated Driving Application Projects

5.1.10 Autonomous Port Partners

5.2 Beijing Trunk Technology

5.2.1 Profile

5.2.2 Development History of Autonomous Ports

5.2.3 L4 Automated Driving Solutions for Port Horizontal Transportation

5.2.4 Port Autonomous Container Trucks

5.2.5 Autonomous Port Application

5.2.6 Partners

5.3 Fabu.Ai

5.3.1 Profile

5.3.2 AI Chips

5.3.3 L4 Autonomous Container Truck Mixed Operation in Ports

5.3.4 L4 Autonomous Container Ship Operation in Ports

5.3.5 Development Plan

5.4 Plusgo

5.4.1 Profile

5.4.2 Development Plan

5.4.3 idriver Full-stack Automated Driving System

5.4.4 Autonomous Container Trucks

5.4.5 Port Automated Driving Application (1)

5.4.6 Port Automated Driving Application (2)

5.4.7 Cooperating with Geely to Launch OEM Port Automated Driving Solutions

5.5 HiRain Technologies

5.5.1 Profile

5.5.2 LiDAR Object Recognition System

5.5.3 Vehicle Control Unit (VCU) for Commercial Vehicles

5.5.4 Autonomous Container Truck Projects

5.5.5 Development Plan

5.6 SENIOR

5.6.1 Profile

5.6.2 Port Autonomous Electric Container Truck

5.7 Deeproute.Ai

5.7.1 Profile

5.7.2 Automated Driving System

5.7.3 Automated Driving System Application

5.7.4 Port Automated Driving Projects

5.7.5 Development Trends of Automated Driving

5.8 TuSimple

5.8.1 Profile

5.8.2 Automated Driving Technology

5.8.3 Port Automated Driving Application

5.9 Yunshan Technologies

5.9.1 Profile

5.9.2 Organizational Structure

5.9.3 Autonomous Port Solutions

5.9.4 Autonomous Trailers for Ports

5.9.5 Build Smart Ports Together with China Merchants Holdings (International) Information Technology (CMHIT)

5.9.6 Autonomous Port Partners

5.10 MoonX.AI

5.10.1 Profile

5.10.2 Port Automated Driving

5.11 ZPMC

5.11.1 Profile

5.11.2 AGV Loading and Unloading System

5.11.3 Autonomous Straddle Carrier (1)

5.11.4 Autonomous Straddle Carrier (2)

5.11.5 Intelligent Container Truck

5.11.6 Large Modern Automated Container Terminal in Middle East

5.12 Sany Marine Heavy Industry

5.12.1 Profile

5.12.2 Port Automated Driving Technology

5.12.3 Implementation of Port Automated Driving Projects
