Autonomous Driving and Cockpit Domain Control Unit (DCU) Industry Report, 2022 (II)

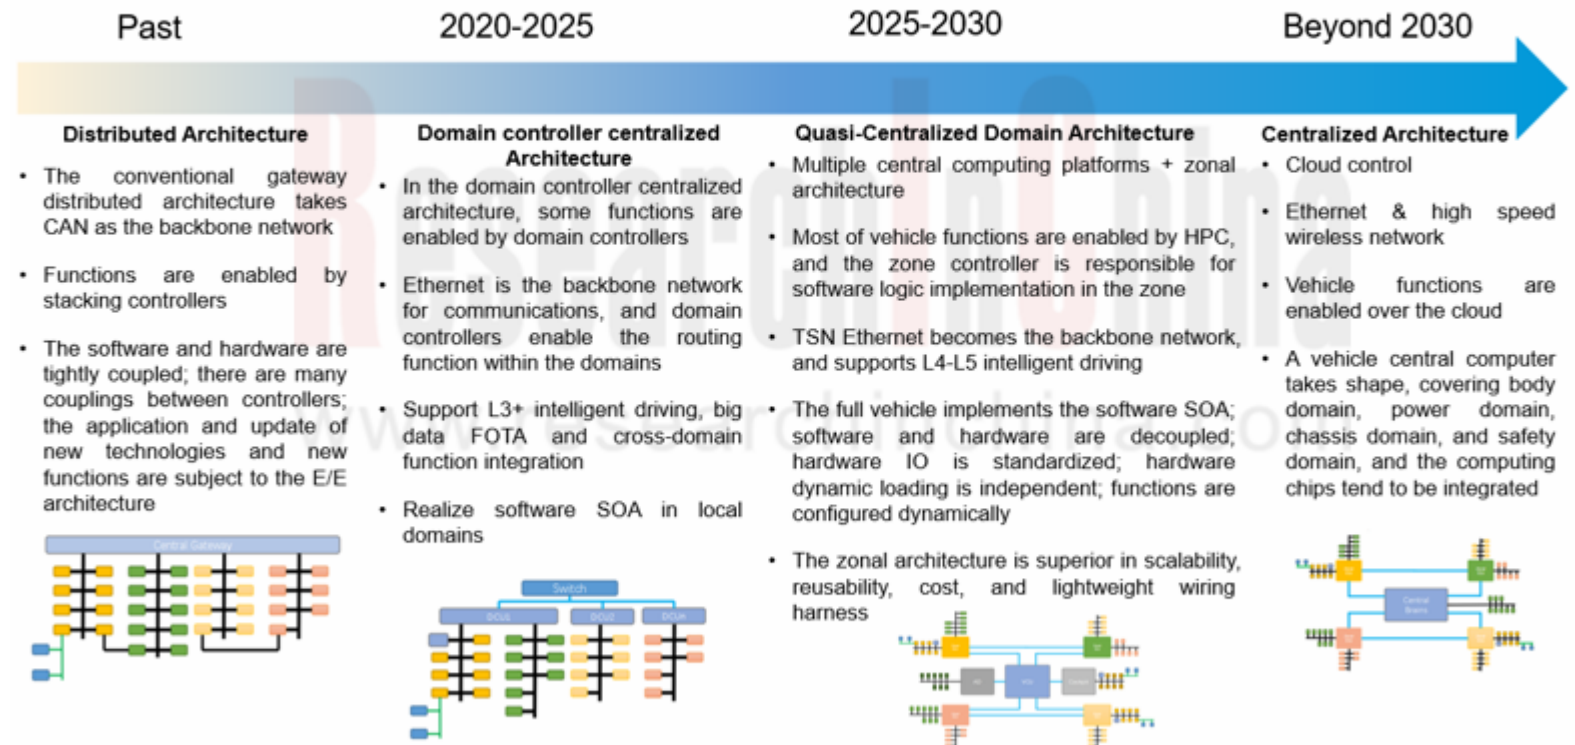

June 2022

Domain Controller Research: Exploration of Five Business Models, Tier1, Tier0.5, Tier1.5 or ODM?

Automakers accelerate the mass production of new E/E architecture platforms, and the penetration rate of domain controllers surges.

In addition to emerging carmakers that adopt new domain controller architectures from the start, conventional automakers have also stepped up the pace of using domain controllers in vehicles. Typical architectures include Geely Sustainable Experience Architecture (SEA), GAC Protoss Architecture, Great Wall E/E Platform (GEEP), BYD E3.0 Platform, and Volkswagen E3 Architecture. Through the lens of development planning, having achieved mass production of domain controller centralized architectures during 2021-2022, most OEMs will produce cross-domain fusion architectures in quantities between 2022 and 2023, and are expected to spawn centralized architectures from 2024 to 2025.

Evolution of Automotive E/E Architecture in the Next Decade

Source: ResearchInChina

China Passenger Car Autonomous Driving Domain Controller Shipments

As OEMs accelerate mass production of new E/E architectures, domain controllers will be a big beneficiary. Taking autonomous driving domain controllers as an example, our statistics show that in 2021, at least 33 OEMs had over 50 production vehicle models equipped with autonomous driving domain controller products, and the number of such production models will surge in 2022.

According to ResearchInChina, China shipped 539,000 autonomous driving domain controllers for passenger cars in 2021, with a penetration rate of 2.7%, a figure expected to exceed 5% in 2022. It is conceivable that in 2025, the annual shipments will reach 4.523 million sets, and the penetration rate will jump to 18.7%; the key driver will be the soaring shipments of L2+ driving and parking integrated domain controllers.

China's Passenger Car Autonomous Driving Domain Controller Shipments, 2019-2025E

Source: ResearchInChina

At present, more than 18 suppliers have launched over 20 L2+ driving and parking integrated domain controllers. In 2022, NOA is to be mounted on vehicles on large scale. Also the lightweight driving and parking integrated solutions using TI TDA4 and Horizon J3 chips have lowered 30% to 50% costs compared with the NVIDIA Xavier-driven solutions, helping "NOA+ automated parking" solutions to fully cover passenger cars priced between RMB100,000 and RMB200,000. The increasing number of passenger cars will support L2+ driving assistance functions such as ramp-to-ramp highway pilot, automated parking and home-AVP.

The L3/L4 high computing power domain controllers with built-in high computing power chips, e.g., NVIDIA ORIN-X, Horizon J5, Huawei Ascend 610, EyeQ6, Qualcomm Ride (8540+9000) and Renesas V3U, support high-precision sensors like LiDAR, 4D radar and multiple 8MP cameras, enabling intelligent driving in all highway, urban and parking scenarios. Currently, they are already in the early phase of small-batch shipments, and largely mounted on over RMB300,000 high-end models.

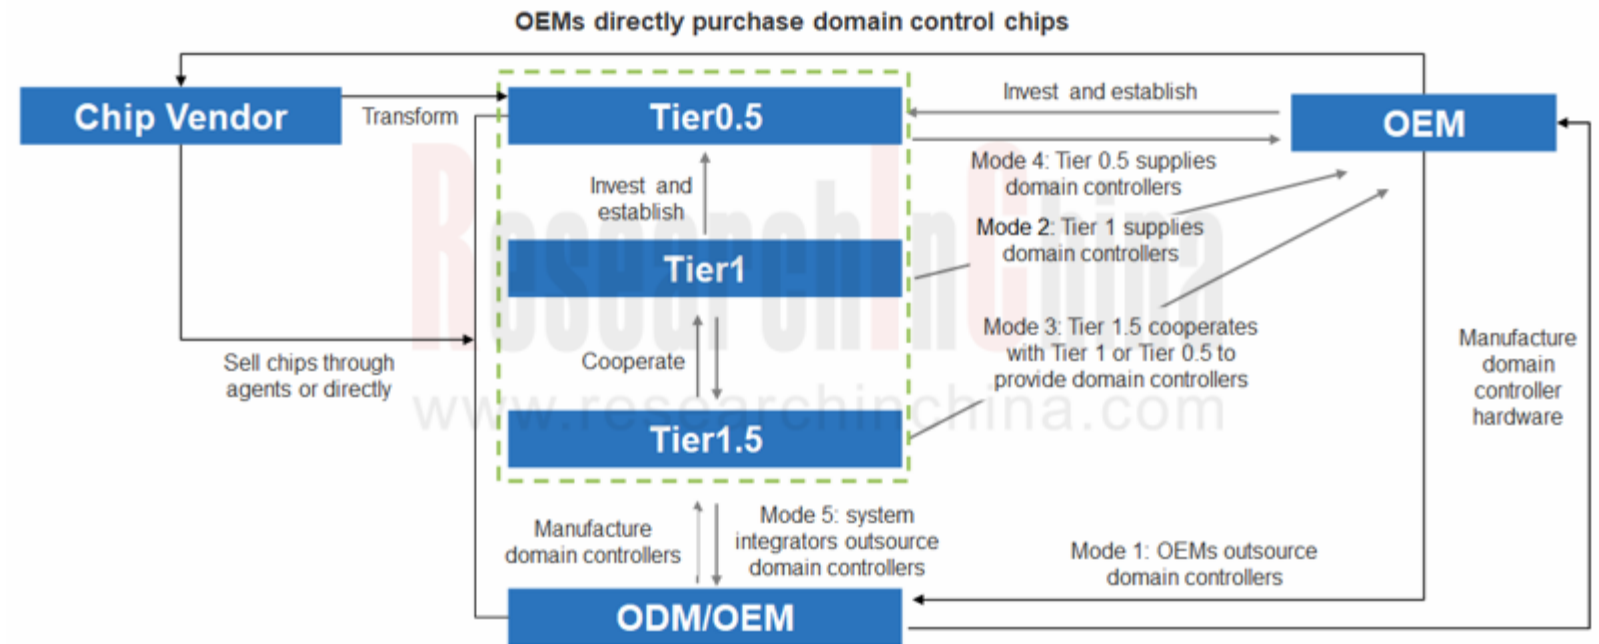

Explore domain controller business models, Tier1, Tier0.5, Tier1.5 or ODM.

Domain controller, as a core component for intelligent connected vehicle platforms, upwardly supports development of application software, and downwardly links E/E architecture and various system components. Its importance is beyond doubt. The competition in the domain controller market tends to be white-hot as multiple business models coexist.

Automakers are of course pleased to see the current competitive landscape. Their partnerships and collaborations with multiple suppliers help them build full-stack self-development capabilities. For automakers, this is also a process of trial and error so as to create a business development model that ultimately suits them.

In short, there are now mainly five domain controller design and production modes:

Exploration of Five Business Models in Domain Controller Design and Production

Source: ResearchInChina

Domain Controller Business Models (1-3)

Model 1: OEMs outsource domain controllers. This model is firstly introduced by Tesla, and then adopted by emerging carmakers like NIO and Xpeng Motors. Tesla designs domain controllers, and entrusts the production to Quanta Computer and Pegatron. NIO seeks support from Wistron and Flex. As well as the most basic hardware manufacture, ODMs/OEMs already begin to set foot in software engineering covering domain controller underlying basic software, and BSP driver.

Model 2: Tier 1 suppliers provide domain controller production for OEMs. It is the most common model of cooperation in current stage. Tier 1 suppliers adopt the white box or gray box model; OEMs have the authority to develop the application layer for autonomous driving or intelligent cockpit. Chip vendors, Tier 1 suppliers, and OEMs often form close partnerships. Chip vendors provide chips and develop software stacks and prototype design packages; Tier 1 suppliers provide domain controller hardware production, intermediate layers, and chip solution integration. Typical cooperation cases of this model include Desay SV + NVIDIA + Xpeng Motors/Li Auto/IM Motors, and ZEEKR + Mobileye + iMotion.

Model 3: Tier 1.5 suppliers born in the trend towards software and hardware separation concentrate their efforts on domain controller basic software platforms. Upwardly, they prop up OEMs to hold the independent development authority of systems, and downwardly integrate Tier 2 suppliers' resources such as chips and sensors. As the originator of this mode, TTTech is currently valued at more than USD1 billion, and introduces key shareholders like Audi, Samsung Electronics, Infineon and Aptiv.

TTTech provides the MotionWise software platform that includes tools and middleware. Technomous co-funded by TTTech and DIAS Automotive Electronic Systems (a company under SAIC) is SAIC's major supplier of autonomous driving domain controllers. In China, Neusoft Reach, EnjoyMove Technology, ArcherMind Technology, Megatronix Technology, ThunderSoft and the like all tend to enter the domain controller supply chain from software.

Meanwhile, Tier 1 suppliers are also playing the role of the Tier 1.5. For instance, in the field of cockpit domain controllers, Bosch which specializes in underlying cockpit software systems outsources hardware production and ecosystem construction to its partner, AutoLink. For Tier 1 suppliers, they are best able to follow the market development trend by providing a range of solutions such as software, hardware, and software and hardware integrated solutions.

Model 4: Tier 0.5 suppliers are born of OEMs' needs for full-stack self-development capabilities. Tier 0.5 suppliers tightly bound with OEMs will partake in the whole process of OEMs from R&D, production and manufacture to even later data management and operation. There are three types of Tier 0.5 suppliers:

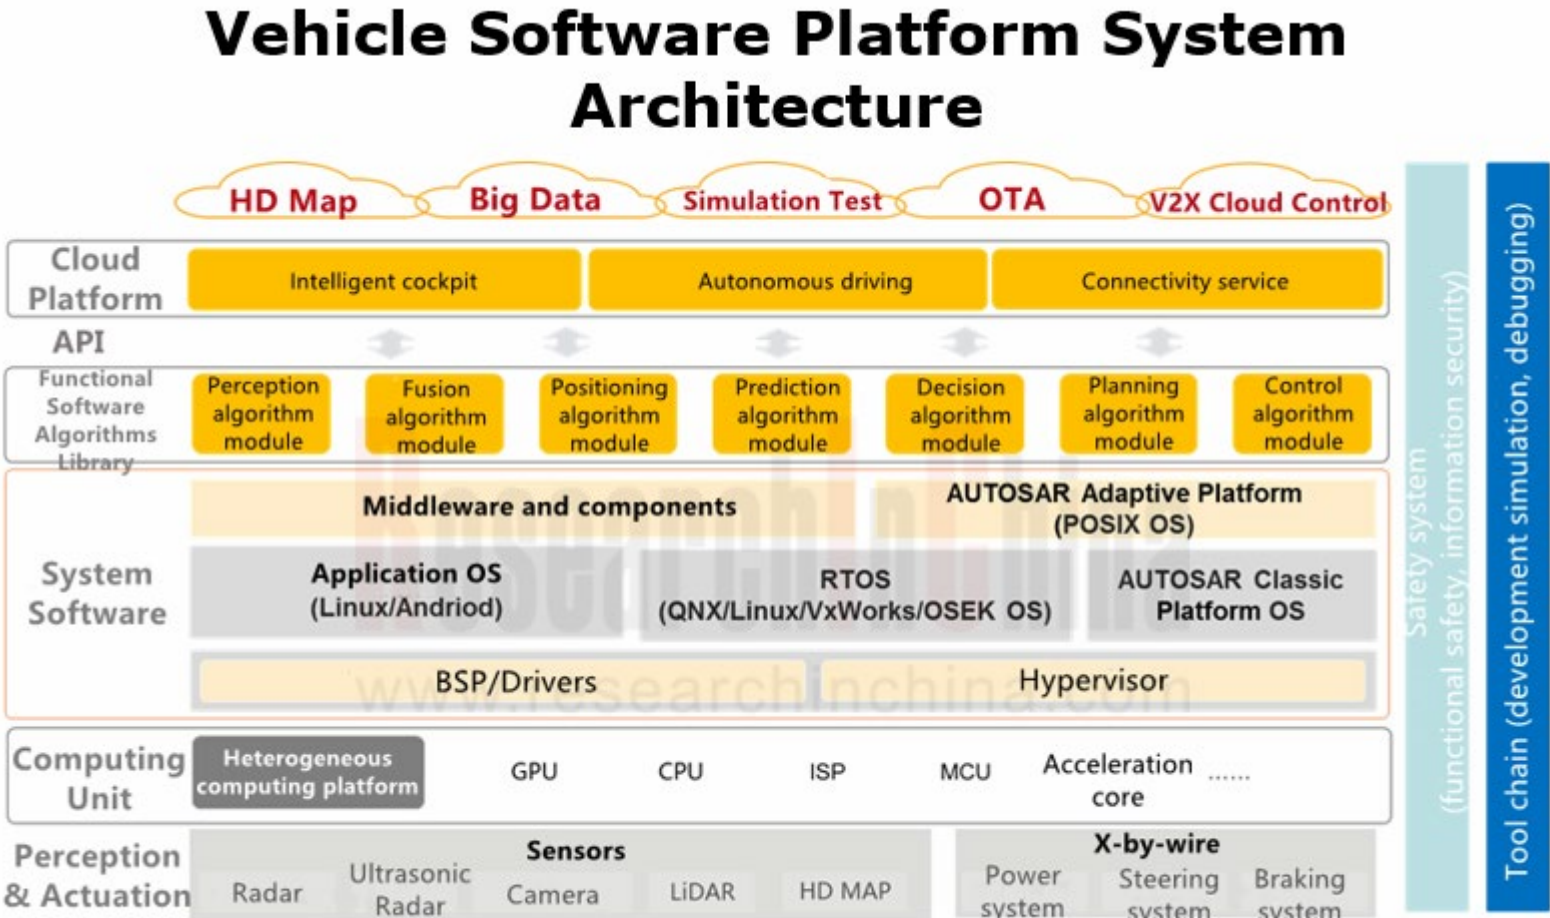

- (1) Some OEMs spin off their parts and components division for independent operation. Examples include DIAS Automotive Electronic Systems under SAIC, Nobo Automotive Technology and Haomo AI under Great Wall Motor, and ECARX under Geely;
- (2) Some OEMs seek partnerships with Tier 1 suppliers to establish joint ventures, for example, Anhui Domain Compute co-founded by Hongjing Drive and JAC, and FulScience Automotive Electronics, a joint venture of Desay SV, FAWER Automotive Parts and FAW.
- (3) Chip vendors transform into Tier 0.5 suppliers. In the context of chip shortage, chip vendors have a bigger say, and even OEMs have to bypass Tier 1 suppliers to purchase directly from them. Chip vendors no longer feel fulfilled in the role as Tier 2 suppliers, and are trying to develop a strong bond with OEMs. Chip vendors participate in OEMs' vehicle model development at the very beginning. For example, Mobileye and Geely built strategic cooperation; after acquiring Veoneer, Qualcomm will work harder to roll out autonomous driving and cockpit cross-domain fusion computing platforms; NVIDIA DRIVE Hyperion 8.1 platform is compatible with both autonomous driving and cockpit, and the chip vendor even attempts to join hands with OEMs on an autonomous driving business profit sharing model.

Model 5: system integrators outsource domain controllers to ODMs/OEMs, especially providers of autonomous driving system solutions and intelligent cockpit software platforms. For instance, Baidu's ACU is produced by Flex, and Haomo AI also cooperates with Flex. Even many autonomous driving start-ups may adopt this model, that is, with ODMs/OEMs providing the automotive OEM hardware production capacity supplement, they supply complete "domain controller + ADAS integrated development" solutions to OEMs, aiming to be better able to compete with conventional Tier 1 suppliers.

Full-stack software system solutions will be the key to gaining competitive edges for domain controller providers.

In the age of software-defined vehicles, full-stack software system solutions will be the key to gaining competitive edges for domain controller providers.

In general, we believe that against a background of software and hardware separation, the full-stack software system development capabilities will play a key part in the future contest. For domain controller providers, the key to gaining competitive edges is the continuous efforts to enrich and build underlying platforms (software-defined hardware, data services, information security, operating systems, etc.), middle-layer platforms (middleware, AutoSAR, chip adaptation, etc.), and application-layer platforms (human-machine interaction (HMI), algorithms, software stack, etc.).

Source: Internet

Full-stack software system solutions will be the key to gaining competitive edges for domain controller providers.

In terms of intelligent cockpit, in PATEO CONNECT+'s case, the company has five core technology platforms: Operating System, Intelligent Voice, Hardware, Map, and Cloud Platform. Based on SOA and software-defined vehicles, PATEO CONNECT+ provides software application development and operation for users in intelligent cockpit, intelligent driving, and body control domain.

The in-depth cooperation with large automakers such as FAW, Dongfeng Motor, BAIC, Geely and SAIC-GM-Wuling allows PATEO to rapidly expand its intelligent cockpit division based on its telematics business. Its solutions from domain controllers and operating systems to hardware, software and cloud three-end intelligent cockpit integrated solutions help automakers create personalized driving experience for users.

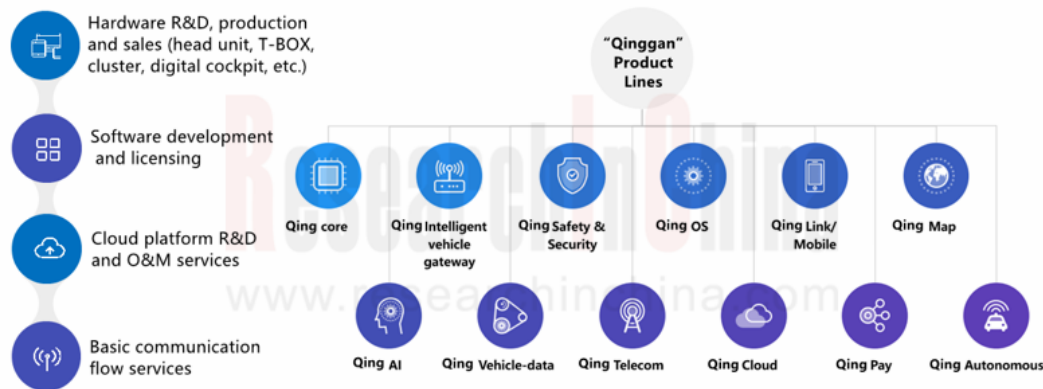

At the hardware end, PATEO's intelligent cockpit domain controller hardware platforms cover Qualcomm 8295/8155, NXP i.MX8QM, MTK8666, and homemade X9H, among others. Its products are led by:

- In April 2020, PATEO's i.MX8QM-based intelligent cockpit product was first mounted on production model BEIJING X7. The use of hardware isolation technology supports operation of Linux + Android dual operating systems on the same hardware.
- In April 2022, PATEO Qinggan 8155 platform fitted on Voyah Dreamer was launched on market. This platform with QNX Hypervisor technology allows operation of QNX + Android dual operating systems on the same hardware. In June, the platform became available to NETA U, NETA Auto's new flagship model. It enables the perfect integration of dashboard and entertainment system, and thus cuts much of the hardware and software cost of intelligent cockpit domain controllers.
- PATEO CONNECT+ is designing and developing the next-generation Qualcomm 8295-based intelligent cockpit platform with higher levels of domain controller integration. The 8295 chip that supports three-domain fusion will favor a sharp reduction in the cost of the cockpit. Compared with the conventional modes of multiple domain controllers and multiple wire harnesses, the three-domain hardware integration based on the 8295 automotive chip platform takes on integrated control over multiple units such as streaming rearview mirror, central display, air conditioner, and lamps. This mode will save the cost of quite a few domain controllers and intelligent component control units. With this mode, PATEO will derive diverse lower-cost solutions from Qinggan 8295-based cockpit when cooperating with different partners, assisting automakers in slashing their cost. PATEO will expand cooperation and develop solutions in such fields as vehicle intelligence, intelligent vehicle connectivity, SOA, cockpit integration, and central controller-based multi-domain fusion. This new cockpit platform is expected to be rolled out on market with related vehicle models in 2023, providing leading immersive intelligent driving experience for automotive industry.

Full-stack software system solutions will be the key to gaining competitive edges for domain controller providers.

At the **software end**, with long-term efforts to develop intelligent cockpit domain controllers from cloud platform to terminal platform, PATEO has built end-to-end design and development capabilities. The cloud end involves technical solution platforms such as CP access, account management, data management, and FOTA. The terminal design and development range from cockpit operating systems to HMI.

Businesses and Product Lines of PATEO CONNECT+

Source: PATEO CONNECT+

As for autonomous driving, taking **Neusoft Reach** as an example, it boasts the following autonomous driving domain controller products:

Neusoft Reach's new-generation central computing platform for autonomous driving based on Horizon Journey?5 chip supports the access to multi-channel LiDARs, 16-channel high-definition cameras, radars and ultrasonic radars, enabling 360° perception redundancy for the whole vehicle. The platform provides L3/L4 autonomous driving functions on the basis of open SOA, and NeuSAR, the basic software self-developed by Neusoft Reach;

Neusoft Reach's driving and parking integrated domain controller for autonomous driving enables the access to 5-10 channels of high-definition cameras, 5-channel radars, and 12-channel ultrasonic radars, of which the cameras deliver up to 8 megapixels. The integration of parking and driving functions and sensor sharing render the enhanced perception capability for L2+ autonomous driving. Through the preset basic software and the autonomous driving-specific middleware, the SOA-based software architecture provides developers with a range of development tools;

Neusoft Reach's X-Box3.0 domain controller enables mass production and application of L0-L3 autonomous driving for multiple scenarios, including multiple function combinations such as interior/exterior scenario, L2-L3 driving scenario, and L3+ parking scenario. This intelligent driving controller has been designated for several production models, and will be mass-produced and put on market in 2022.

In April 2022, Neusoft Reach introduced a software development platform for domain controllers - NeuSAR DS (Domain System). As a complete underlying software development platform, verification system and tool chain for domain controllers (central domain, cockpit domain and intelligent driving domain), NeuSAR DS is designed for OEMs and offers all general software functions between hardware and application layers. The platform provides a wealth of software development and debugging tools, virtualization validation systems, integrated systems, environment deployment services (e.g., IDE), commercial POSIX OS, and third-party OS integration, as well as chip BSP and secure boot solutions.

Table of Content (1)

2 Evolution of Domain Controller Software and Hardware Architectures and Business Models

2.1 Domain Controller Hardware Design

2.1.1 Domain Controller Hardware Architecture

2.1.2 Hardware Architecture Upgrade: ECU Hardware Architecture Upgrade

2.1.3 Communication Architecture Upgrade: Vehicle Backbone Network Evolves to Ethernet

2.1.4 Power Architecture Upgrade: The Power Topology Is Getting More Complex

2.1.5 Challenges in Domain Controller Hardware Design: Power Integrity (PI)

2.1.6 Challenges in Domain Controller Hardware Design: Signal Integrity (SI)

2.1.7 Challenges in Domain Controller Hardware Design: EMC

2.1.8 Challenges in Domain Controller Hardware Design: Power Consumption and Heat Dissipation

2.1.9 Challenges in Domain Controller Hardware Design: Designed Service Life

2.1.10 Challenges in Domain Controller Hardware Design: Testing and Verification

2.1.11 Challenges in Domain Controller Hardware Design: Higher Requirements for Process

2.2 Domain Controller Software Design

2.2.1 Domain Controller Software Architecture

2.2.2 Domain Controller Software Architecture Upgrade: Software Architecture Is Upgraded to Adaptive AutoSAR

2.2.3 "Full-stack Self-development" System Frameworks of OEMs and Tier 1 Suppliers (1)

2.2.4 "Full-stack Self-development" System Frameworks of OEMs and Tier 1 Suppliers (2)

2.2.5 "Full-stack Self-development" Cases of OEMs and Tier 1 Suppliers (1)

2.2.6 "Full-stack Self-development" Cases of OEMs and Tier 1 Suppliers (2)

2.3 Domain Controller Design and Production Models

2.3.1 Domain Controller Design and Production: Five Procurement Models (1)

2.3.2 Domain Controller Design and Production: Five Procurement Models (2)

2.3.3 Domain Controller Design and Production: Five Procurement Models (3)

2.3.4 Domain Controller Design and Production: Three Cooperative Development Models

2.3.5 Domain Controller Design and Production: Three Profit Sharing Models

2.4 Domain Controller ODM/OEM Production Model

2.4.1 Domain Controller ODM/OEM Production Model: Mode of Cooperation

2.4.2 Domain Controller ODM/OEM Production Model: Core Players

2.4.3 Domain Controller ODM/OEM Production Model: Typical Cooperation Cases

4 Research on Intelligent Cockpit Domain Controller Technology and Market

4.1 Evolution of Intelligent Cockpit Domain

4.1.1 Development Trends of Intelligent Cockpit

4.1.2 Trend 1: Following EEA Trends, Cockpit Domain Evolves Towards Domain Fusion, Central Computing and Cloud Computing

4.1.3 Trend 2: Intelligent Cockpit Cross-Domain Fusion (1)

4.1.4 Trend 2: Intelligent Cockpit Cross-Domain Fusion (2)

4.1.5 Trend 3: in Hardware Architecture, Cockpit SoCs Evolve Towards High Computing Power, Scalability and Artificial Intelligence

4.1.6 Trend 4: in Hardware Architecture, Pluggable Hardware Interfaces Support Vehicle Head Unit Hardware System Upgrade

4.1.7 Trend 5: Software Architecture Will be SOA-based Vehicle-Cloud Integrated Platform Architecture

4.1.8 Trend 6: in Software Architecture, Cockpit Software Platforms Tend to Adopt Layered Design

6.11.12 Domain Controller Capacity: Building A Smart Factory	6.13.9 Autonomous Driving Domain Controllers: Technical Parameters and Architecture of TITAN 3
6.12 Unlimited AI	6.13.10 Autonomous Driving Domain Controllers: System Framework of TITAN 3
6.12.1 Profile	6.13.11 Autonomous Driving Domain Controllers: Performance Parameters of TITAN 3
6.12.2 Intelligent Driving Domain Controllers: Mode of Cooperation	6.13.12 Autonomous Driving Software Platform: Athena
6.12.3 Intelligent Driving Domain Controllers: Product Lines	6.13.13 TITAN and PALLAS: Verified in a Real Vehicle with a Full Visual Perception Solution
6.12.4 Software-Defined ADAS All-in-One	6.13.14 TITAN and PALLAS: Verified in a Real Vehicle with a Full Visual Perception Solution
6.12.5 L2.99 Multifunctional Intelligent Driving Domain Controller: "Wukong No.1"	6.13.15 In-Driving Cooperated with Huawei: Jointly Released a Minibus Solution with Huawei MDC
6.12.6 L2.99 Intelligent Driving Domain Controller: Mass-Produced and Mounted on Chery Big Ant	6.14 Yihang.AI
6.12.7 L2.99 Intelligent Driving Domain Controller: Technical Advantages	6.14.1 Autonomous Driving Mass Production Path
6.12.8 L2.99 Intelligent Driving Domain Controller: Hardware Architecture	6.14.2 NOA Driving and Parking Integrated Solution (1)
6.12.9 L2.99 Intelligent Driving Domain Controller: Specifications and Interface Capabilities	6.14.3 NOA Driving and Parking Integrated Solution (2)
6.12.10 Dual J3+X9H High Performance Multi-Domain Controller	6.14.4 All-Scenario Full Self-Driving (FSD) Solution
6.12.11 Dual J3 Intelligent Driving Domain Controller	6.15 Baidu
6.12.12 Vehicle Central Computer (HPC)	6.15.1 Autonomous Driving Domain Controllers: Roadmap
	6.15.2 Autonomous Driving Domain Controllers: Product Layout

Table of Content (7)

6.15.3 Technical Features of Autonomous Driving Computing Platform 1.0 (Wuren)/2.0 (Sixi)/3.0 (Sanxian)	6.18 Hangsheng Electronics
6.15.4 Autonomous Driving Computing Platform: Cooperated with NVIDIA on Use of DRIVE Orin Chip in “Sanxian” Domain Controller	6.18.1 Product Layout
6.15.5 Autonomous Driving Computing Platform ACU (Sixi)	6.18.2 Intelligent Cockpit Ecosystem
6.15.6 Autonomous Driving Computing Platform ACU (Sixi) Uses TI TDA4 Processor	6.18.3 Intelligent Cockpit Rapid Iteration Capability
6.15.7 Apollo Focuses on Promoting ANP+AVP Global Intelligent Driving System	6.18.4 New-Generation Cockpit Domain Controllers Based on Qualcomm 8155
6.15.8 Apollo 6.0 Autonomous Driving Solution	6.18.5 Cockpit Domain Controllers: Product Planning
6.15.9 Apollo's Fifth-Generation Robotaxi Model - Apollo Moon	6.19 BICV
6.15.10 Apollo Autonomous Driving Scenario Was Implemented	6.19.1 Profile
6.15.11 Intelligent Cockpit: Apollo Internet of Vehicles	6.19.2 Business Layout of Parent Company BDStar Navigation
6.16 Jingwei Hirain	6.19.3 Intelligent Cockpit Domain Controllers
6.16.1 Profile	6.19.4 Visual Controller (CVBOX)
6.16.2 Autonomous Driving Domain Controllers: Product Line Layout	6.20 UAES
6.16.3 Intelligent Driving Domain Controller (ADCU) and Vehicle High Performance Computing Platform (HPC)	6.20.1 XE and UAES Software Platform (USP) of Cross-Domain Control Business Division
6.16.4 ADAS Domain Controllers	6.20.2 Vehicle Computing Platform (VCP)
6.16.5 ADAS Domain Controllers: Performance Characteristics	6.20.3 Zone Controllers
6.17 Joynext	6.20.4 Scalable Domain Controller Platform: XCU 8.0
6.17.1 Cockpit Domain Controllers: Business	6.20.5 AUTOSAR-based Open Software Platform
6.17.2 Cockpit Domain Controllers: Software Architecture (1)	6.20.6 SOA Application under New EEA (1)
6.17.3 Cockpit Domain Controllers: Software Architecture (2)	6.20.7 SOA Application under New EEA (2)
6.17.4 Intelligent Cockpit Evolution Route	6.20.8 SOA Software and Conventional Embedded Software
6.17.5 Human-Machine Copilot System: Intelligent Cockpit HMI for High-Level Autonomous Driving	6.20.9 Vehicle Computing Platform Software Architecture and USP Software Platform
6.17.6 Cockpit and Autonomous Driving Domain Controllers: Development Progress	6.21 Youkong Zhixing
	6.21.1 Profile
	6.21.2 Domain Controllers: Planned Business Directions
	6.21.3 Autonomous Driving Domain Controllers: Hardware Platform (1)
	6.21.4 Autonomous Driving Domain Controllers: Hardware Platform (2)
	6.21.5 Autonomous Driving Domain Controllers: Software Platform Architecture

Table of Content (8)

- 6.21.6 Autonomous Driving Domain Controllers: Implementation of Software Functions
- 6.21.7 Autonomous Driving Domain Controllers: Technical Highlights or Differentiation
- 6.21.8 Autonomous Driving Domain Controllers: Product Development Planning
- 6.21.9 Autonomous Driving Domain Controllers: Performance Parameters of EAXVA04 / EAXVA05
- 6.21.10 Autonomous Driving Domain Controllers: Performance Parameters of EAXVA03
- 6.21.11 Autonomous Driving Domain Controllers: Cooperative Customers
- 6.21.12 Autonomous Driving Domain Controller Application Cases: Meituan Autonomous Delivery Vehicle
- 6.21.13 Autonomous Driving Domain Controller Application Cases: Yutong L4 Autonomous Bus
- 6.21.14 Youkong Zhixing and Black Sesame Technologies Developed an Intelligent Driving Computing Platform
- 6.22 Idriverplus
 - 6.22.1 Three Core Business Lines
 - 6.22.2 Autonomous Driving Brains: AVDC+AVOS+BBOX (1)
 - 6.22.3 Autonomous Driving Brains: AVDC+AVOS+BBOX (2)
 - 6.22.4 Autonomous Driving Brains: Application Cases
 - 6.22.5 Autonomous Driving Brains: AVOS and AVCU
 - 6.22.6 Autonomous Driving Brains: AVOS Software System Architecture
- 6.23 DJI Automotive
 - 6.23.1 Profile
 - 6.23.2 Three Major Solutions for Intelligent Driving
 - 6.23.3 Autonomous Driving Domain Controllers: Features
 - 6.23.4 Autonomous Driving Domain Controllers: Middleware

- 6.23.5 Autonomous Driving Domain Controllers: Mass-produced and Mounted on SAIC-GM-Wuling Baojun
- 6.24 EnjoyMove Technology
 - 6.24.1 Profile and Products
 - 6.24.2 Intelligent Domain Controller: DCU3.0
 - 6.24.3 DCU3.0: Technical Features
 - 6.24.4 DCU3.0: System Architecture Design
 - 6.24.5 DCU3.0: Adopting L3 Functional Safety Design
 - 6.24.6 DCU3.0: Driving and Parking Integrated System Architecture Design
 - 6.24.7 High Performance Computing Software Platform: EMOS1.0
 - 6.24.8 High Performance Computing Software Platform: Technical Features of EMOS1.0
 - 6.24.9 High Performance Computing Software Platform: Multi-Domain Fusion Software Platform
 - 6.24.10 Multi-Domain Fusion Computing Platform
 - 6.24.11 Business Model
- 6.25 Novauto
 - 6.25.1 Profile
 - 6.25.2 Computing Platform for High-Level Advanced Autonomous Driving: NOVA30P
 - 6.25.3 NOVA30P: Technical Architecture and Features
 - 6.25.4 Automatic Compression Tool: NOVA-Slim
 - 6.25.5 Training and Acceleration Tool: NOVA-3D
 - 6.25.6 NOVA-Box Intelligent Driving Computing Platform
 - 6.25.7 NOVA-Box Computing Platform Solutions (1)
 - 6.25.8 NOVA-Box Computing Platform Solutions (2)
 - 6.25.9 NOVA-Box Computing Platform Solutions (3)
 - 6.25.10 Partners

Table of Content (9)

6.26 Intron Technology

6.26.1 Intron Technology and Horizon Robotics Jointly Developed an Autonomous Driving Domain Controller

6.26.2 L3 and above Autonomous Driving Domain Controllers: System Architecture (1)

6.26.3 L3 and above Autonomous Driving Domain Controllers: System Architecture (2)

6.26.4 CAELUS Autonomous Driving Domain Controller Solution: Based on Xilinx MPSoC

6.27 Yuanfeng Technology

6.27.1 Profile

6.27.2 Mass-Produced Qualcomm 8155-based Intelligent Cockpit Domain Controller

6.28 AutoLink

6.28.1 Profile

6.28.2 Layout of Intelligent Cockpit Domain Controller Capacity

6.28.3 AutoLink and Bosch Jointly Developed a Cockpit Domain Controller
